Lab 2: Agile Backlog Creation & Sprint Simulation in Jira
Project: Corporate Mental Wellness & Counseling Platform

Name: Rohan Rampura Praveen Kumar
SRN: PES1UG24CS382
Section: G

Objective

To utilize Jira to convert Lab 1 functional requirements into Agile backlog items (Epics and User Stories), assign story point estimates, execute a two-sprint simulation, and analyze team performance using a Burndown Chart.

Epics & User Stories

Epic 1: Employee Anonymity & Wellness Assessment

Description: Enables corporate employees to maintain complete privacy via pseudo-IDs while taking self-administered mental health assessment tests.

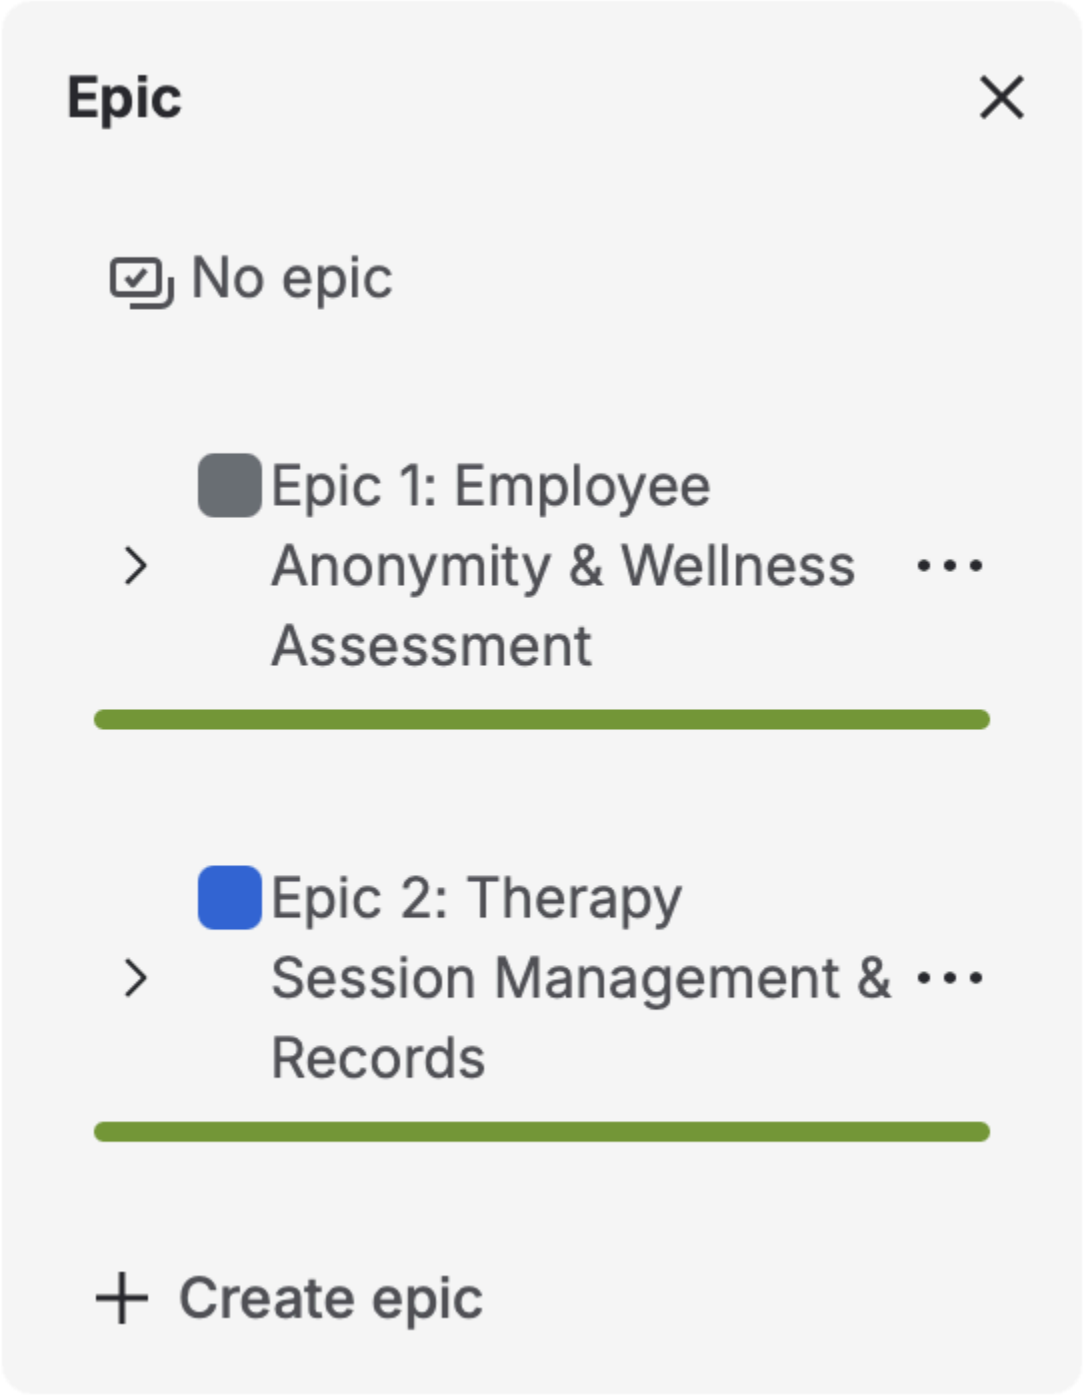

- **CWP-3 (Story 1.1) — Pseudo-ID Account Masking:** As an employee, I want an anonymized pseudo-ID generated for my profile, so that my corporate email and identity are hidden from therapists. *(Priority: Highest | Estimate: 3 Story Points)*
- **CWP-4 (Story 1.2) — Stress Assessment Module:** As an employee, I want to complete self-administered stress tests, so that I can view instant feedback on my mental wellness. *(Priority: Medium | Estimate: 5 Story Points)*
- **CWP-6 (Story 1.3) — Wellness History Tracking:** As an employee, I want to view historical assessment scores on a personal dashboard, so that I can monitor my progress over time. *(Priority: Low | Estimate: 2 Story Points)*

Epic 2: Therapy Session Management & Records

Description: Provides secure appointment booking for anonymous sessions and enables licensed therapists to log clinical notes.

- **CWP-5 (Story 2.1) — Therapist Appointment Booking:** As an employee, I want to browse available time slots and book counseling sessions, so that I can receive professional support. *(Priority: High | Estimate: 8 Story Points)*

- **CWP-7 (Story 2.2) — Anonymized Clinical Notes:** As a licensed therapist, I want to attach post-session notes exclusively to an employee's pseudo-ID, so that clinical progress is recorded securely. *(Priority: High | Estimate: 5 Story Points)*

Burndown Chart

How to read this chart

CWP Sprint 1 | Story Points

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes. Applying the Fibonacci scale allowed us to properly distinguish complex integration tasks such as timezone adjusted appointment scheduling and cryptographic pseudo-ID mapping (8 story points) from simpler interface features like wellness history displays (2 story points).

2. Was your backlog well-prioritized?

Yes. Core privacy features (`CWP-3`) and appointment booking (`CWP-5`) were assigned Highest/High priorities to ensure foundational anonymity and booking flows were implemented before lower-priority features like personal analytics.

3. How did your simulated sprint align with your plan?

In Sprint 1, 8 out of 21 committed story points were completed as complex security and booking tasks took longer than anticipated. The remaining items carried over into Sprint 2, where all 23 total story points across both Epics were successfully completed.

4. What insights did the burndown chart give about your team's capacity?

The initial flat line followed by a sharp drop in remaining story points during Sprint 1 indicated an over-commitment relative to actual velocity. Adjusting the workload in Sprint 2 demonstrated that our optimal sprint capacity is approximately 12–15 story points per 1-week iteration.
